

ATLASSIAN

An Agile project management mindset can be hard to implement. We help organizations make the transition by leveraging Atlassian products to enable their success.

Our team advises on and configures Atlassian products in Atlassian's cloud-hosted and self-hosted environments (either on-prem or in AWS) so that you're able to get the most out of your teams and investment. Our solutions are implemented with highly-available (HA) multi-node configurations, Identity and Access Management integrations (including 2-factor authentication), and run on multiple technology stacks (e.g. Oracle, PostgreSQL, MySQL, Linux, Windows).

US GOVERNMENT

"You all came in here with the technical knowledge we needed, but I'm amazed at how quickly you understood and improved our business processes as well."

*Project Manager
Higher Education Institution*

Jira Software

Our experience setting up and running Agile projects leveraging Jira has ranged from custom web applications to Salesforce CPQ implementations to Oracle ERP upgrades. We not only work on the technical configuration/implementation, but also collaboratively with clients to ensure their Jira environment is set up to maximize productivity, satisfaction, and management-level reporting while remaining scalable and easy to maintain.

Leveraging the Atlassian suite is not something that we just do for our customers, it's a key component of how we do business internally. Our projects are managed using Jira and Confluence with dedicated agile scrum masters. Internal corporate tasks are requested and managed with Jira Service Management.

Confluence

If you're in need of more discipline and sophistication in your documentation, leveraging Confluence can get you there. Along with configuring and training users to collaborate in real-time within Confluence, we build tight integrations with Jira and leverage popular add-ons that enhance the experience and turn it into a powerful analytics tool to understand user behaviors and increase adoption.

Jira Service Management

We set up Jira Service Management to support internal and external teams, clients, and partner communities. Our technical writers help you build content for How-To articles that integrate seamlessly with the Jira Service Management portal. Organizations need to integrate and manage processes that will help their people understand the translation of Jira Service Management requests into Jira issues and we can help.

"M&S always bring a strong team and processes to their projects. The collaboration we find in their use of both Atlassian Jira and Confluence streamline our communication and work coordination."

Mark Albert, Associate Vice President for Business Intelligence and Enterprise Services

Bitbucket and DevOps

We have been aiding organizations in implementing version control systems for many years, and working with Bitbucket enhances the experience by serving as a bridge from Agile project management to sophisticated DevOps orchestration. We also integrate Bitbucket with Jira, so developers can interact with Jira projects and tickets within the Bitbucket UI. Developers don't have to switch applications to keep tickets updated or see new ticket assignments. In addition, project managers and team leads are able to see development information right from Jira.

Bamboo

Our team of DevOps experts leverage industry-leading CI/CD technologies to build robust, fully automated pipelines for building, testing, and deploying code changes. Atlassian Bamboo enables organizations to streamline their development processes while providing tight integrations with other industry-leading Atlassian offerings such as Atlassian Jira and Bitbucket to enable fast feedback on successes and failures in the pipeline.

Crowd and Access

We have deep expertise in Identity and Access Management across a wide range of industry-standard IAM products. Our team can help you streamline your authentication flows for your Atlassian software stack by leveraging Atlassian Crowd alongside your company's identity provider, such as Microsoft Active Directory.

We help organizations by implementing both simple sign-on solutions as well as single sign-on (SSO) solutions to allow for seamless login to multiple on-prem Atlassian products by requiring a user to enter credentials multiple times if at all. We have also integrated identity solutions using biometrics and common access cards (CAC).
